Defining The Project
C.Pay

1. What is the project?
The C.Pay project is a project to build a Matrix bot that can hold, receive, and send cryptocurrencies conveniently and efficiently.

For the end-user, the main benefit of using the bot would be increased privacy for crypto trading and convenience. (Along with zero transfer fees between users)

2. What is the MVP (Minimal Viable Product)?
The minimal viable product is a bot that can allow Matrix users to (without fees*) exchange cryptocurrency with each other as well as support crypto deposits and withdraws.

*Users would be able to send/trade crypto across their Matrix accounts free of fees. The only way you would have fees is if you withdrew from your account. (e.g. blockchain fees and a 3% bot service fee.)

3. What are the nice to haves?
   • Increase User Privacy (More details will be explained in Usage)
   • Sleek Frontend User Interface
   • Support Multiple Cryptocurrencies

4. When will the project be complete?
The current goal is Jan 1st, 2024, at the latest. To maximize efficiency, the project would be broken up into focused chunks for concentrated development.
